Comments for the draft ROV posted 13 February 22018 :

The second quarter 2017 results for arsenic are an anomaly when compared to the first and third quarters.

First Quarter: 21 tunnel = 150.4; upstream = 2.49; downstream = 1.17

Second Quarter: 21 tunnel = 1,308; upstream 101.7; downstream 70.82

Third Quarter: 212 tunnel = 718.6; upstream = 598.7; downstream = 282.8

The analysis of this series of sampling is odd. A significant contributing factor is weather. Below the 21 tunnel three weather (rain and to a lesser degree snow) related surface water flows dump into Kanaka Creek before it leaves the property. The Second Quarter test result of 1,308 is inconsistent with the relationships of the other quarters. An important reason to wave MMP's is the fact that this high test result did not affect the arsenic level downstream. It had no negative environmental effect of Kanaka Creek and its environment. There was zero negative issue for any beneficial parties downstream. It is an odd one time occurrence.

On behalf of our Company and its miners, please remove the possible \$18,000 penalty. No one and nothing was hurt.

Sincerely,

Michael Meister Miller,

President
